

ABSTRACT

2 A displaying apparatus comprises: a displaying part for displaying a picture; a selection
3 input part for selecting for display a highlight portion within the picture of the displaying part; a
4 storage part for storing data according to the selection made through the selection input part; and
5 a controller for generating a highlight signal corresponding to the highlight portion based on the
6 selected data, for composing or combining the highlight signal and the video signal to thereby
7 generate a composed or combined video signal, and for displaying the highlight portion within
8 the picture of the displaying part based on the composed or combined video signal. With this
9 configuration, the size, position and brightness of a highlight portion can be adjusted, as desired,
10 by specifying the highlight portion within a picture of a displaying part. A method for
11 controlling such a displaying apparatus includes steps corresponding to the functions of the
12 various components of the displaying apparatus, as described above.
